

Exterior Veneers

Exterior Veneers – Klaser Tile has installed well over 3 million square feet of exterior veneers over the last twenty years. The veneers included thin-brick, various stones and ceramic tile. The success of these lasting installations is indicative of the quality of work Klaser Tile dedicates to their projects. Installing thin veneers on an exterior wall is very complex, and is a job Klaser Tile takes very seriously. Industry standards are meticulously followed and many quality control procedures are employed to ensure their installers' compliance. Klaser Tile only uses the best installation methods and the best installation products to further ensure a lasting installation.

The traditional scratch and brown coat is recommended by Klaser Tile as the base for the veneer. Klaser Tile makes sure the components that affect their work being provided by other trades, are compatible and allow them to provide a quality finished product. Klaser Tile will verify that the architect call-out and employs industry standards in the application's design as indicated in the project drawings and specifications.

Stone Veneers – Klaser Tile has installed more than two million square feet of thin stone veneers. Most of the stone projects have been cut-to-fit stone sizes to meet architectural design criteria. It is well understood that on large projects, where multiple containers of stone are coming from other countries, quality control and timing is paramount. Klaser Tile has traveled to the quar-

ries to establish quality control guidelines and to make sure the material delivered meets those guidelines. Natural stone varies in color and sizing, so Klaser Tile makes sure the clients understand limitations and ensures they get what they expect. Every precaution is taken to ensure timely delivery of quality products. Klaser Tile employs the best methods for installing stone, taking into consideration the unique characteristics of the type of stone.

Ceramic Tile Veneers – Klaser Tile has installed many ceramic tile veneers. Like stone, ceramic tile has color and sizing variations to some degree, depending on the type of ceramic tile being used. Unlike some stones, ceramic tile is usually consistent in sizing and less forgiving in respect to how the tile is set in place. Klaser Tile makes sure that the base is plumb and allows the tile to have as flat of a surface as possible. Quality control guidelines for ceramic tile are used to make sure orders are delivered on time, they meet the sizing and color requirements, and they are installed correctly.

Thin-Brick Veneers – Klaser Tile has installed many thin-brick veneers. Unlike stone and ceramic tile, brick can be more irregular in sizing. Quality control guidelines for thin-brick are also used to make sure orders are delivered on time, they meet the sizing and color requirements, and they are installed correctly.

Commitment to Quality – Klaser Tile is committed to providing a quality finished product by installing it correctly and providing it on time.
